

## **Method and Apparatus Maintaining Eye Contact in Video Delivery Systems Using View Morphing**

### Abstract

A view morphing algorithm is applied to synchronous collections of video  
5 images from at least two video imaging devices, and interpolating between  
the images, creates a composite image view of the local participant. This  
composite image approximates what might be seen from a point between the  
video imaging devices, presenting the image to other video session  
participants.
